GENERAL INFORMATION:
APPLICANT: GONG, Fangcheng et al.
TITLE OF INVENTION: ISOLATED HUMAN ENZYME P
TITLE OF INVENTION: ACID MOLECULES ENCODING
TITLE OF INVENTION: THEREOF
FILE REFERENCE: CL001195
CURRENT APPLICATION NUMBER: US/09/819,993
CURRENT FILING DATE: 2001-03-29
NUMBER OF SEQ ID NOS: 5
SOFTWARE: FastSEQ for Windows Version 4 ^
SEQ ID NO 2
LENGTH: 478
TYPE: PRT
                                                                                                                                                                                                                                                                                                    ; ORGANIS

; Sequence 2, Application US/10193295
; Patent No. 6620608
; GENERAL INFORMATION:
APPLICANT: GONG, Fangcheng et al.
APPLICANT: GONG, Fangcheng et al.
TITLE OF INVENTION: ISOLATED HUMAN ENZYME PROTEINS, NUCLEIC
TITLE OF INVENTION: ACID MOLECULES ENCODING HUMAN ENZYME PROTE
TITLE OF INVENTION: THEREOF
FILE REFERENCE: CL001195DIV
CURRENT APPLICATION NUMBER: US/10/193,295
CURRENT FILING DATE: 2002-07-12
PRIOR APPLICATION NUMBER: 08/819,993
PRIOR FILING DATE: 2001-03-29

NUMBER OF SEQ ID NOS: 5
SOFTWARE: FastSEQ for Windows Version 4.0
SEQ ID NO 2
LENGTH: 478
TYPE: PRT
ORGANISM: Human

IS-08-305-505-4

Sequence 4, Application US/08305505

Patent No. 5668001

GENERAL INFORMATION:
APPLICANT: Miziorko, Henry M.
TITLE OF INVENTION: 3-HYDROXY-3

TITLE OF INVENTION: SYNTHASE PRI
TITLE OF INVENTION: STABILITY

NUMBER OF SEQUENCES: 6

CORRESPONDENCE ADDRESS:
ADDRESSEE: Quarles & Brady

STREET: 411 East Wisconsin Av.
CITY: Milwaukee

STATE: Wisconsin

COUNTRY: U.S.A.
ZIP: 53202

COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC compatible
OPERATING SYSTEM: PC-DOS/MS-D
SOFTWARE: PatentIn Release #1

CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/305
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Que

APPLERA CORP. Yan C, 2001US-00819993. 2001US-00819993. (first entry) Di Francesco protein; 478 **,** AA. Beasley A synthase protein. genotype;

The invention discloses an isolated nucleic acid molecule encoding a human hydroxymethylglutaryl-coenzyme A (HMG-CoA) synthase which is important in cholesterologenesis. The polynucleotide and polypeptide are useful as models for the development of human therapeutic targets, to aid in the identification of therapeutic proteins and as targets for the development of human therapeutic agents that modulate the activity of the polypeptide in cells and tissues. The polynucleotide is useful for activity of the effectiveness of modulating compounds on the expression or activity of the enzyme gene in clinical trials and in treatments, in diagnostic assays for qualitative changes in expression of enzyme nucleic acid, to detect mutations in enzyme genes and gene expression products,

New syn

isolated nucleic acid molecule encoding hydroxymethylglutaryl-CoAthase, useful as model for the development of human therapeutic gets and for identifying therapeutic proteins.

The polypeptide is useful to raise antibodies, as a reagent in assays designed to quantitatively determine levels of the protein in biological fluids, as markers for tissues in which the corresponding protein is preferentially expressed (e.g. carcinomas), in biological assays related to members of the synthase subfamily, in drug screening assays, in competition binding assays, in cell-based or cell-free systems, in pharmacogenomic analysis and for treating a disorder characterised by an absence of, inappropriate, or unwanted expression of the polypeptide. The sequence presented is the human HMG-CoA synthase protein, the gene for which is located on chromosome 5

that shows a high degree of similarity to human cytoplasmic 3-hydroxy-3-methylglutaryl coenzyme A (FMG-CoA) synthase. The invention also discloses polynucleotide sequences encoding the novel enzyme of the invention. Both the polypeptide and polynucleotide sequences are useful as models for the development of human therapeutics, for identifying therapeutic proteins, as targets for development of human therapeutic as encoding the novel enzyme of the invention. Both the polypeptide and polynucleotide sequences are useful casematics, and as query sequences to perform a search against sequence data bases to identify other family members of related sequences. The polypeptide is useful to raise antibodies or to elicit another immune response, as a reagent in assays designed to quantitatively determine levels of the protein in biological fluids, as markers for tissues in which the corresponding protein is preferentially expressed, in drug state, or an altered form that causes the specific disease or pathology associated with the synthase activity of the protein in its natural conjugated with the synthase, to screen a compound for the ability to state, or an altered form that causes the specific disease or pathology associated with the synthase, to screen a compound for the ability to pharmacogenomic analysis. The polynucleotide is useful for monitoring the pharmacogenomic analysis. The polynucleotide is useful for monitoring the pharmacogenomic analysis. The polynucleotide is useful for activity of the human synthase gene in clinical trials or in a treatment regimen, in diagnostic assays for qualitative changes in a human synthase nucleic acid that leads to a pathology, for testing an individual for a genotype that while not necessarily causing a disease, nevertheless affects the creatment modality, and as antisense constructs to control human synthase gene in control human synthase gene captured the control human synthase gene antisense constructs to control human synthase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated human synthase peptide and gene encoding the enzyme, as models for developing human therapeutic targets, aid in the identification of therapeutic proteins and as therapeutic targets
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 2003-352594/33.

ACC62346 to ACC62465 represent
sequences, which are used in 6
ABR54277 represents a human to
the human NOV35b protein in the
                                    antiparkinatic, metabolic, immunomodulator, neuroprotective, nootropic, antiparkinsonian and antilipaemic activities, and can be used in gene therapy. NOVX proteins are useful for treating or preventing a pathology associated with the NOVX protein in humans and for treating a syndrome associated with the human disease. NOVX nucleic acids, proteins and antibodies can be used in the treatment and diagnosis of cardiomyopathy, atherosclerosis, hypertension, congenital heart defects, aortic stenosis, valve disease, tuberous sclerosis, scleroderma, obesity, transplantation, congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic disorders, neoplasm, lymphoma, uterus cancer, fertility, haemophilia, hypercoagulation, idiopathic thrombocytopenic purpura, graft versus host disease, AlDS, bronchial asthma, Crohn's disease, multiple sclerosis, infectious disease, anorexia, cancer-associated cachexia, cancer, Alzheimer's disease, Parkinson's disease, immune disorders, haematopoietic disorders, dyslipidaemias, and metabolic syndrome X. ACC62346 to ACC62465 represent PCR primers and probes for human NOVX sequences, which are used in examples from the present invention.

ABR54277 represents a human trypsinogen protein given in comparison with the human NOV35b protein in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gan

ACC62236 to ACC62345 encode the human NOVX proteins (54167 to ABR54276. NOVX sequences have antiatherosclerotic, otensive, dermatological, anorectic, immunosuppressive, cylidiabetic, antiinfertility, haemostatic, antiinflammatory, iasthmatic, metabolic, immunomodulator, neuroprotective, notiparkinsonian and antilipaemic activities, and can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SDB;

The present invention describes isolated human NOVX proteins, where X is 1 to 42. ACC62236 to ACC62345 encode the human NOVX proteins given in CC ABR54167 to ABR54276. NOVX sequences have antiatherosclerotic, cardiant, Dypotensive, dermatological, annorectic, immunosuppressive, cytostatic, antiidiabetic, antiinfertility, haemostatic, immunosuppressive, cytostatic, antiidiabetic, antiinfertility, haemostatic, antiinflammatory, anti-HIV, CC antiparkinsonian and antilipaemic activities, and can be used in gene conting a pathology associated with a NOVX protein in humans and for treating a syndrome associated with the human disease. NOVX nucleic acids, proteins and can be used in the treatment and diagnosis of cardiomyopathy, anti-Hodies can be used in the treatment and diagnosis of cardiomyopathy, congenital adrenal hypertension, congenital heart defects, aortic stenosis, congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic disease, neoplasm, lymphoma, uterus cancer, diabetes, metabolic disease, neoplasm, lymphoma, uterus cancer, fertility, haemophilia, cc disease, anorexia, cancer-associated cachexia, cancer, alzheimer's disease, anorexia, cancer-associated cachexia, cancer, alzheimer's disease, parkinson's disease, immune disorders, cancer, alzheimer's disease, parkinson's disease, immune disorders, cancer, captaled acchexia, cancer, anorexia, cancer-associated cachexia, cancer, alzheimer's disease, parkinson's disease, immune disorders, cancer, alzheimer's disease, anorexia, cancer-associated cachexia, cancer, alzheimer's disease, parkinson's disease, immune disorders, cancer, alzheimer's disease, alzheimer's disease, anorexia, cancer-associated cachexia, cancer, alzheimer's disease, al

REFERENCE STATE ST
                                                   the present invention describes isolated number when proteins given in C 1 to 42. ACC62236 to ACC62345 encode the human NOVX proteins given in C ABR54167 to ABR54276. NOVX sequences have antiatherosclerotic, cardiant, hypotensive, dermatological, anorectic, immunosuppressive, cytostatic, c antidiabetic, antiinfertility, haemostatic, antiinflammatory, anti-HIV, c antiparkinsonian and antilipaemic activities, and can be used in gene therapy. NOVX proteins are useful for treating or preventing a pathology associated with the human disease. NOVX nucleic acids, proteins and cantibodies can be used in the treatment and diagnosis of cardiomyopathy, c atherosclerosis, hypertension, congenital heart defects, aortic stenosis, valve disease, tuberous sclerosis, scleroderma, obesity, transplantation, congenital adrenal hyperplasia, prostate cancer, fertility, haemophilia, hypercoagulation, idiopathic thrombocytopenic purpura, graft versus host disease, AIDS, bronchial asthma, Crohn's disease, multiple sclerosis, alzhelmer's disease, anorexia, cancer-associated cachexia, cancer, Alzhelmer's disease, arkinson's disease, immune disorders, cancer, ACC62346 to ACC623465 represent PCR primers and metabolic syndrome X. ARR54277 represents a human trypsinogen protein in comparison with the human NOV35b protein in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gangolli EA, Gerlach VL, Kekuda R, Khramtsov NV, Malyankar UM, Miller CE, Pena CEA, Rieger DK, Rot Spaderna SK, Spytek KA, Zerhusen BD, Zhong M;

The present invention describes isolated human NOVX proteins, where X is 1 to 42. ACC62236 to ACC62345 encode the human NOVX proteins given in C ABR54167 to ABR54276. NOVX sequences have antiatherosclerotic, cardiant, hypotensive, dermatological, anorectic, immunosuppressive, cytostatic, antialdiabetic, antiinfertility, haemostatic, antiinflammatory, anti-HIV, antiatherosclerotic, antiinfertility, haemostatic, neuroprotective, nootropic, antiparkinsonian and antilipaemic activities, and can be used in gene therapy. NOVX proteins are useful for treating or preventing a pathology associated with a NOVX protein in humans and for treating a syndrome associated with the human disease. NOVX nucleic acids, proteins and antibodies can be used in the treatment and diagnosis of cardiomyopathy, atherosclerosis, hypertension, congenital heart defects, aortic stenosis, congenital darenal hyperplasia, prostate cancer, diabetes, metabolic disorders, neoplasm, lymphoma, uterus cancer, diabetes, metabolic disease, anorexia, cancer-associated cachexia, cancer, Alzheimer's disease, anorexia, cancer-associated cachexia, cancer, Alzheimer's disease, parkinson's disease, immune disorders, cancer, caccayate to ACC62465 represent PCR primers and metabolic syndrome X. ARS4277 represents a human trypsinogen protein given in comparison with the human NOV35b protein in the exemples from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gangolli EA, Gerlach VL,

                                                                                                                                                                                                                                                                                                                                                                                                    ঠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes isolated human NOVX proteins, where X is 1 to 42. ACC6236 to ACC62345 encode the human NOVX proteins given in ABR54167 to ABR54276. NOVX sequences have antiatherosclerotic, cardiant, hypotensive, dermatological, anorectic, immunosuppressive, cytostatic, antidiabetic, antiinfertility, haemostatic, antiinflammatory, anti-HIV, antidabetic, antiinfertility, haemostatic, antiinflammatory, anti-HIV, antiparkinsonian and antilipaemic activities, and can be used in gene therapy. NOVX proteins are useful for treating or preventing a pathology associated with a NOVX protein in humans and for treating a syndrome associated with the human disease. NOVX nucleic acids, proteins and antibodies can be used in the treatment and diagnosis of cardiomyopathy, atherosclerosis, hypertension, congenital heart defects, aortic stenosis, cangenital adrenal hyperplasia, prostate cancer, diabetes, metabolic disease, neoplasm, lymphoma, uterus cancer, diabetes, metabolic hypercoagulation, idiopathic thrombocytopenic purpura, graft versus host cisease, allow, bronchial asthma, Crohn's disease, multiple sclerosis, haematopoietic disease, anorexia, cancer-associated cachexia, cancer, halphalase, parkinson's disease, immune disorders, cancer, haematopoietic disorders, dyslipidaemias, and metabolic syndrome X. ACC62346 to ACC62465 represent PCR primers and probes for human NOVX sequences, which are used in examples from the present invention with the human NOV35b protein in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                     Que

Novel human proteins and nucleic acid encoding the proteins, useful for diagnosis, treatment and prevention of disorders involving the human protein or nucleic acid e.g. cardiac and neurological disorders.

Claim 1; Page 246; 460pp; English.

The present invention describes isolated human NOVX proteins, where X is 1 to 42. ACC62236 to ACC62345 encode the human NOVX proteins given in ABR54167 to ABR54276. NOVX sequences have antiatherosclerotic, cardiant, C hypotensive, dermatological, annorectic, immunosuppressive, cytostatic, antiinfertility, haemostatic, antiinflammatory, anti-HIV, C antiasthmatic, metabolic, immunomodulator, neuroprotective, nootropic, associated with a NOVX protein in humans and for treating a pathology c associated with the human disease. NOVX nucleic acids, proteins and atherosclerosis, hypertension, congenital heart defects, aortic stenosis, C valve disease, tuberous sclerosis, sclerosis, echeroderma, obesity, transplantation, congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic disease, neoplasm, lymphoma, uterus cancer, fertility, haemophilia, hypercoagulation, idiopathic thrombocytopenic purpura, graft versus host c disease, AIDS, bronchial asthma, Crohn's disease, multiple sclerosis, hazheimer's disease, parkinson's disease, immune disorders, cancer, hazheimer's disease, parkinson's disease, immune disorders, haemophilia, chocalle to ACC62465 represent PCR primers and metabolic syndrome X. ACC62346 to ACC62455 represent PCR primers and probes for human NOVX sequences, which are used in examples from the present invention. The human NOV35b protein in the exemplification of the present invention. Sequence 520 AA,

The present invention describes isolated human NOVX proteins, where X is 1 to 42. ACC6236 to ACC62345 encode the human NOVX proteins given in ABR54167 to ABR54276. NOVX sequences have antiatherosclerotic, cardiant, hypotensive, dermatological, anorectic, immunosuppressive, cytostatic, antiidiabetic, antiinfertility, haemostatic, antiinflammatory, anti-HIV, antiparkinsonian and antilipaemic activities, and can be used in gene therapy. NOVX proteins are useful for treating or preventing a pathology associated with a NOVX protein in humans and for treating a syndrome associated with the human disease. NOVX nucleic acids, proteins and antibodies can be used in the treatment and diagnosis of cardiomyopathy, atherosclerosis, hypertension, congenital heart defects, arctic stenosis, valve disease, tuberous sclerosis, sclerosis, scleroderma, obesity, transplantation, congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic disease, neoplasm, lymphoma, uterus cancer, fertility, haemophilia, hypercoagulation, idiopathic thrombocytopenic purpura, graft versus host disease, AIDS, bronchial asthma, Crohn's disease, multiple sclerosis, lacked, to ACC62346 to ACC62465 represent PCR primers and metabolic syndrome X. ACC62346 to ACC62465 represent PCR primers and metabolic syndrome X. ACC62346 to ACC62465 represent PCR primers and probes for human NOVX and the properties of the properties of the properties of the properties of the properties.

Novel human proteins and nucleic acid encoding the proteins, useful diagnosis, treatment and prevention of disorders involving the human protein or nucleic acid e.g. cardiac and neurological disorders.

Claim 1; Page 245; 460pp; English.

The present invention describes isolated human NOVX proteins, where X is 1 to 42. ACC6236 to ACC62345 encode the human NOVX proteins given in ABR54167 to ABR54276. NOVX sequences have antiatherosclerotic, cardiant, C hypotensive, dermatological, anorectic, immunosuppressive, cytostatic, antiinfertility, haemostatic, inmunosuppressive, cytostatic, antiinfertility, haemostatic, neuroprotective, nootropic, antiparkinsonian and antilipaemic activities, and can be used in gene therapy. NOVX proteins are useful for treating or preventing a pathology associated with a NOVX protein in humans and for treating a syndrome associated with the human disease. NOVX nucleic acids, proteins and antibodies can be used in the treatment and diagnosis of cardiomyopathy, atherosclerosis, hypertension, congenital heart defects, aortic stenosis, congenital adrenal hyperplasia, prostate cancer, diabetes, metabolic disease, neoplasm, lymphoma, uterus cancer, diabetes, metabolic hypercoagulation, idiopathic thrombocytopenic purpura, graft versus host confectious disease, anorexia, cancer -associated cachexia, cancer, haemophilia, confectious disease, anorexia, cancer -associated cachexia, cancer, haematopoietic disorders, dyslipidaemias, and metabolic syndrome X. ACC62346 to ACC62346 represent PCR primers and probes for human NOVX sequences, which are used in examples from the present invention.

Charactery and the present invention of the present invention with the human NOV35b protein in the exemplification of the present invention. Sequence 520 AA;

The present invention describes isolated human NOVX proteins, where X is 1 to 42. ACC62236 to ACC62345 encode the human NOVX proteins given in ABR54167 to ABR54276. NOVX sequences have antiatherosclerotic, cardiant, hypotensive, dermatological, anorectic, immunosuppressive, cytostatic, antidabetic, antiinfertility, haemostatic, antiinflammatory, anti-HIV, antiasthmatic, metabolic, immunomodulator, neuroprotective, nootropic, antiparkinsonian and antilipaemic activities, and can be used in gene therapy. NOVX proteins are useful for treating or preventing a pathology associated with a NOVX protein in humans and for treating a syndrome associated with the human disease. NOVX nucleic acids, proteins and antibodies can be used in the treatment and diagnosis of cardiomyopathy, atheroselerosis, hypertension, congenital heart defects, aortic stenosis, valve disease, tuberous sclerosis, sclerosers, diabetes, metabolic disorders, neoplasm, lymphoma, uterus cancer, diabetes, metabolic disease, allows, idiopathic thrombocytopenic purpura, graft versus host chiesease, AlDS, bronchial asthma, Crohn's disease, multiple sclerosis, haematopoietic disorders, dyslipidaemias, and metabolic syndrome X. ACC62346 to ACC62465 represent PCR primers and probes for human NOVX sequences, which are used in examples from the present invention. The human NOV35b protein in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gan

Novel human proteins and nucleic acid encoding the proteins, useful diagnosis, treatment and prevention of disorders involving the human protein or nucleic acid e.g. cardiac and neurological disorders.

Page 244; 460pp; English.

HERETE KREET The present invention describes isolated human NOVX proteins, where X is CC 1 to 42. ACC62236 to ACC62345 encode the human NOVX proteins given in CC ABR54167 to ABR54276. NOVX sequences have antiatherosclerotic, cardiant, CC hypotensive, dermatological, ancerctic, immunosuppressive, cytostatic, CC antidiabetic, antiinfertility, haemostatic, antiinflammatory, anti-HIV, CC antisthmatic, metabolic, immunomodulator, neuroprotective, nootropic, CC antiparkinsonian and antilipaemic activities, and can be used in gene CC associated with a NOVX protein in humans and for treating a pathology associated with the human disease. NOVX nucleic acids, proteins and CC antibodies can be used in the treatment and diagnosis of cardiomyopathy, CC atherosclerosis, hypertension, congenital heart defects, aortic stenosis, CC valve disease, tuberous sclerosis, scleroderma, obesity, transplantation, CC disorders, neoplasm, lymphoma, uterus cancer, diabetes, metabolic disease, alds, brochial asthma, Crohn's disease, multiple sclerosis, C haematopoietic disease, anorexia, cancer-associated cachexia, cancer, Alzheimer's disease, anorexia, cancer-associated cachexia, cancer, C Alzheimer's disease, Parkinson's disease, immune disorders, C ACC62346 to ACC62465 represent PCR primers and metabolic syndrome X. Sequences, which are used in examples from the present invention. With the human NOV35b protein in the exemplification of the present invention. Sequence 520 AA;

The invention discloses a composition comprising two or more isolated rat or human polynucleotides or a polynucleotide which represents a fragment, derivative or allelic variation of the nucleic acid sequence. Also claimed are a vector comprising the novel polynucleotide, a host cell comprising the vector, a method for identifying a nucleotide sequence which is differentially regulated in an animal subjected to pain and a kit to perform the method, an array, a method for identifying an agent that increases or decreases the expression of the polynucleotide sequence that is differentially expressed in neuronal tissue of a first animal subjected to pain, a method for identifying an agent the expression of a polynucleotide sequence which is differentially expressed in an animal subjected to pain, a method for identifying a compound which regulates the activity of one or more of the polynucleotides, a method for producing a pharmaceutical composition, a method for identifying a compound useful in treating specification, a method for identifying a compound useful in treating pain and a pharmaceutical composition comprising the one or more goain (e.g. spinal segmental nerve injury (Chung), chronic constriction injury (CCI) and spared nerve injury (SNI)) in an animal (e.g. gene therapy). The sequence presented is a human protein (shown in Table 2 of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 2003-
